

Michael Potts

Statistics, Machine Learning

COVER LETTER

My background has provided me a wealth of knowledge and skills important for the field of data science. I have previously worked as a patient data abstractor, directly reviewing several thousand charts for inclusive criteria. As well, I worked as a Registered Nurse where I learned how to sift through immense amounts of information to recognize important details and how they relate together to improve overall patient outcomes and care. All this experience has provided me with excellent critical thinking skills, the proficiency to quickly process and analyze data, as well as the ability to build rapport with ease. In 2020, I started pursuing a career in research and worked as a research assistant at the startup - TLEC innovations. This allowed me to gain invaluable experience within the research world, to stretch my ability with technical research (renewable energy dealing with battery technology, catalyst discovery/research and mechanical streamlining).

During my Master degree at UIUC, I have had the opportunity to work on several projects, many of my own design. I designed a prototype Bluetooth diabetic foot monitor which also connected to a Kivy based android app which accompanied it. Further to this, I replicated, updated, and altered a deep learning patient mortality prediction model which used a latent space representation as part of its classification algorithm. As part of my studies, I had been introduced to a large variety of machine learning models and some of the newest deep learning algorithms discussed in the current literature. I have also had the opportunity to develop an IOT self-driving car, computer vision(openVINO), mapping, and collision avoidance algorithms, as well as a big data analytic machine learning project around vehicle GHG emission prediction and modeling. I was accepted into the Sunstella machine learning research program which is dedicated to exposing graduate students to the research process, preparing students for a PhD in a data science/machine learning, and interning with them: I worked in Health AI with a physician-informaticist who is researching the long-term effects of various respiratory illnesses on pediatric patients using graph neural networks and clinical feature extraction. This project taught me how to implement research-based algorithms in practical, real-world models. In my spare time, I find myself working on personal machine learning projects including creating robotic prosthetics, and a portable auto iv inserter.

Currently, I work at Canuck Place and act as principal statistician and health care researcher to analyze patient data. During my tenure, I have been responsible for coordinating several projects, and working to support the other members of Siden lab: My projects involve multivariate time series data analysis (statistical and machine learning) to evaluate the fragility of our patients and better manage their symptoms. As well, I am working on analyzing the health care needs and burden for children and families with severe, life-limiting illness. I have had the opportunity to speak at several presentations at Child Bright 2023, BB&D 2023, and Canuck Place, all relating to both my project data analyses, as well as to AI's place in health care.

It is my goal to improve upon and create targeted AI that helps people in a direct way.

EDUCATION —

University of Illinois – Urbana Champaign
Master of Computer Science (Data Science)
2021-2022 GPA – 4.0

Applied Machine Learning
Internet of Things A+
Deep Learning for Health Care
Advanced Bayesian modeling
Data Visualization A+
Theory and Practice of Data Cleaning
Foundations of data curation
Text Information Systems A+

2020 – 2021 Pre-requisites – GPA – 4.0:

Single and Multivariate Calculus
Linear Algebra
Computer Programming (C++)
Data structures and algorithms (C++)

University of British Columbia 2012-2017
Bachelor of Science in Nursing - GPA 3.9

KEY SKILLS —

Primary Languages: Python, C++, R, MySQL, SAS

Secondary Languages: Javascript, HTML

Applications: classification, clustering, regression, deep learning, machine learning, time series analysis, dimension reduction, data pipelines, sentiment analysis, object detection, image classification, natural language processing

Packages: Pytorch, Tensorflow, NumPy, Pandas, Sklearn, SPSS, Jupyter, Anaconda, OpenCV, Git, Matplotlib, Linux, Excel, Kivy, OpenRefine, Tableau, D3, AWS, Docker, SaS, Apache Spark

EXPERIENCE

March 2023 – March 2024 –Contract - full time

Statistician and Health Care Researcher • Canuck Place Childrens Hospice
Worked with the medical director and research coordinator to research palliative patients. Performed machine learning, geo-analysis, and statistical analysis to forecast palliative care needs in BC, performed statistical analysis on condition-pain correlation, and presented findings at Child Bright.

May 2022 – July 2022

Data Science (deep learning) Research • Sunstella machine learning research
I worked on a pediatric classification program utilizing graph neural networks and neural backed decision forests to classify the severity and level of care required infections.
2020 – Jan. 2022

Research Assistant • TLEC Innovations

I worked as a technical researcher, investigating various chemical catalyst structures and properties for development and use in an exhaust recapture prototype. Further, I edited and developed corporate proposals and presentations in addition to creating several quality of life programs for the company (text message filter, company website, data storage and monitoring).
2017 - 2020

Registered Nurse • Cardiac and Community Care • Interior Health

2016 - 2016

Data Abstractor • Kelowna Injury Surveillance Collaborative

PROJECTS

Sunstella – Researched extending graph neural network models to improve prediction of hospitalization and severity of illness in pediatric respiratory patients

Deep Learning – Assignments covering deep learning, CNNs, Seq2Seq, RNNs, autoencoders, attention models, GNNs, memory networks and generative models. Recreated and improved upon a latent space correlational neural network model.

IOT – Created a diabetic foot monitor and app that monitors feet for trauma and proper care. Created a self-driving car that accepts coordinates, implements object detection and avoidance as well as intelligently handles different types of obstacles.

Applied Machine Learning – Assignments covering classification, regression, clustering, expectation maximization, high dimensional data, and convolutional neural networks. Project predicting vehicle GHG emissions on 16.3 million vehicle data set.

Self – I am designing a novel prototype IV inserter, as well as a prototype automated hand and finger prosthetic.

AWARDS + CERTIFICATES

Professional Presentations:

Child Bright – Pain and Symptoms in Children with Neurological Impairment	2023
Canuck Place Childrens Hospice – AI and it's place in health care	2023
BB&D – Patient Syndrome forecasting through clustering time-warped latent space representations	2023

Professional Certificates and Development:

Data or Specimens Only Research - MIT	2022
Electrical engineering crash course – Khan Academy	2020
Python for everybody – University of Michigan	2019
Cultural Sensitivity Modules – UBCO	2017
Nursing Preceptor (educating 2 nd and 3 rd nursing students) - UBCO	2017
Tri-Council Policy Statement - Ethical Conduct for Research Involving Humans	2016
Nursing related (11 additional)	2012- 2018

Awards:

Deputy Vice Chancellor Scholarship	2013
Chancellors' scholar Award	2012
Ron Sweeney Rising Star Award	2012
Dr. David Clarke Bursary	2012
Coast Capital Education Award	2012
Provincial Scholarship Award	2012
